TITLE : METALLIC CARRIER FOR  
ELECTRICALLY HEATING TYPE  
CATALYTIC DEVICE

ABSTRACT : PROBLEM TO BE SOLVED: To apply a  $\geq 10 \mu\text{m}$  thick insulating coating film on an insulating plate for forming a metallic carrier for electrically heating type catalytic device and to enable to solder the plate for abutting on the surface having the insulating coating film.

SOLUTION: An undercoating film 2 having  $\leq 50 \mu\text{m}$  thickness is formed by melt-spraying a Ni-Cr or Ni-Al on the surface 1a of a base material 1 of the insulating plate. A zirconium oxide  $\text{MgO-ZrO}_2$  (zirconia) stabilized by a stabilizing element is melt-sprayed thereon to form the  $10\text{-}200 \mu\text{m}$  thickness insulating coating film and further, a soldering coating film 4 having  $\leq 50 \mu\text{m}$  thickness is formed thereon by melt-spraying a soldering material consisting essentially of Ni.
